Utilities for decimal sign conversion

On our website, we have 2 small utilities for comma/point decimal sign conversion, one for each direction. For bigger data files, these should be faster than using an editor. Also, the point-to-comma version is aware that the comma is used as field separator in CSV files („comma separated values"): points are changed to commas, commas are changed to semicolons.

Download:
www.systat.de\Transfer\decimal-sign-utilities.zip
In the zip file:
- data-to-decimalpoint.exe
- data-to-decimalcomma.exe
- readme.txt

These are command line utilities which you can run at a command prompt.

The syntax is:
program_name [infile] [outfile] <RETURN>

If called without parameters, it prompts for the missing filenames.
If outfile name is "=" (without the quotes), infile name plus "to-..." is used as outfile name.

Note:
These tools are supplied as is. There is no error checking performed for available disk space, or overwriting existing files with the same name.
